

THE AGRICULTURAL PRODUCTIVITY GAP: ONLINE APPENDIX

DOUGLAS GOLLIN

DAVID LAGAKOS

MICHAEL E. WAUGH

ABSTRACT

This document details the data sources for the paper “The Agricultural Productivity Gap,” by Gollin, Lagakos and Waugh. It also contains the final data set used in the paper’s calculations.

Corresponding author: David Lagakos, Department of Economics 0508, University of California, San Diego, 9500 Gilman Drive, La Jolla, CA 92093-0508, lagakos@ucsd.edu.

A. Online Appendix

In this section we provide more detail about the data sources used in the paper. Section I.A describes the Living Standards Measurement Surveys and our associated calculations, while Section I.B details the sources for our data on hours worked and years of schooling. Section I.C provides the final data set used in the paper.

I.A. Living Standards Measurement Surveys

The Living Standards Measurement Surveys (LSMS) have been conducted in a number of developing countries over the last three decades. They are conducted in most cases by the World Bank and the national statistical agencies in the country in question. We make use of ten of these surveys, which are listed in Table 1 below, along with their sample sizes (the number of households surveyed.)

Table 1: LSMS Surveys

Country	Survey	Sample Size
Armenia	Household Budget Survey, 1996	4,920
Bulgaria	Multitopic Household Survey, 2003	3,023
Cote d'Ivoire	Cote d'Ivoire Living Standards Survey, 1988	1,600
Guatemala	National Survey of Living Standards, 2000	7,276
Ghana	Ghana Living Standards Survey, 1998	5,998
Kyrgyz Republic	Kyrgyz Poverty Monitoring Survey, 1998	2,934
Pakistan	Pakistan Integrated Household Survey, 1991	4,800
Panama	Survey of Living Standards of 2003	5,591
South Africa	South Africa Integrated Household Survey, 1993	8,811
Tajikistan	Living Standards Survey, 2009	1,500

Each of the surveys in Table 1 are *nationally representative* surveys of households, and employ a two-stage sampling methodology. In the first stage, a set of “primary sampling units,” (PSU) or geographic regions, are chosen at random from an existing list. One can think of PSUs as “villages” in rural areas and “neighborhoods” in urban areas. In the second stage, a set of

households are chosen at random from each PSU. Every member in the sampled households are then interviewed. While survey content varies from country to country, all of them cover basic demographic information, educational attainment, employment status in the last week, month and/or year. For households employed in agricultural production of any kind, there is an agriculture module which contains detailed questions on agricultural outputs, such as the quantity of each crop grown, and inputs, such as fertilizer use or the cost of hired labor. For households with non-agricultural production, there is an additional module with questions about the type of business, revenues, and input costs.

For each country, we compute the share of employment in agriculture as the fraction of all economically active persons aged 15 or greater whose primary employment is in agriculture, hunting or fishing. We define economically active persons to be those who are either employed or seeking work at the time of the survey. Following the national accounts methodology, we do not use a minimum hours worked threshold. We compute the share of value added by sector using equations (5), (6), (7) and (8). The prices used to value output are either the locally prevailing price paid to producers, or the households' reported price that it would receive, depending on the crop and survey. We define the input costs to be all expenditures on hired labor, rented equipment or land, repair services, purchased fertilizer or seeds, or any other expenditure listed on the survey questionnaire.

In each survey, some of the aggregation to the household level has been computed by the World Bank and/or the national statistical agency associated with the survey. We make use of these aggregated variables where available. For example, in all surveys the total value of agricultural output by household has already been constructed. In some surveys, labor income at the individual level has already been aggregated to include wage and in-kind payments plus bonuses at all jobs. In others, the input costs of non-agricultural or agricultural businesses have been aggregated to the household level. In all surveys, the World Bank or statistical agencies have imputed missing variables or re-coded outliers (or missing variables) where they deemed appropriate. We drop any additional households with missing income data, although typically this involves a very small number of records. We do not drop any outliers, although we found

that our results are robust to dropping the top and bottom 1 percent of households by income or consumption.

Wage income, self-employment income and capital income are all measured before taxes. Wage income is measured at the individual level and then aggregated to the household level. It includes all payments in currency or in kind plus any bonuses received at primary, secondary or other jobs. Capital income is measured directly at the household level, and varies slightly from country to country in what is available. In most countries, capital income includes payments from rental of land, housing, or other property, plus interest payments. Most countries do not record dividends from shares of business owned but not controlled, as income from these sources is likely to be quite small in these countries.

We do *not* include transfer payments, gifts, inheritances or “other income” in any of our income calculations. The rationale is that while these income sources are relevant items in the budget constraints of individual households, they do not correspond to income from a national accounting perspective. Put differently, they do not correspond with production of new goods or services by the households in the survey.

Measures of household expenditure have been aggregated by broad expenditure category by the World Bank or relevant statistical agency in each of the surveys. We compute total household expenditure to be the sum of purchased food and non-food non-durable expenditures, plus service expenditures, plus the value of food or non-food items produced and consumed directly by the households. Some surveys also contain the imputed value of durables owned by the households, which we include if it is available. The yearly flow value of durables is imputed as the price paid for the durable good divided by an estimate of its usable life in years. In all surveys, these computations are made in the same way for agricultural and non-agricultural households.

All of the LSMS surveys are publicly available (often at no charge) from the World Bank website. For more on any individual survey, a basic information document is available for each country, as are the survey questionnaires themselves. Our household-level data (and our com-

puter code used to construct it) is available upon request for each country where our user agreement permits us to share it.

I.B. Hours and Schooling by Sector

Table 2 below details the sources of data on schooling and hours used for each country in our data set. If not otherwise indicated, the samples include only economically active individuals aged 15 or greater, schooling is computed as the number of years of schooling completed, hours worked means the total number of hours worked in the reference week of the sample, and workers are classified by industry using the industry of primary employment if employed, the primary industry of previous employment if unemployed, or rural-urban status if unemployed and previous industry is not available. Whenever urban-rural status was used in place of agricultural non-agricultural status this is marked in the final column of the table. All other deviations are indicated using footnotes.

Our final country-level data set, including the raw and adjusted agricultural productivity gaps, average hours worked by sector, average schooling by sector, and human capital by sector is available upon request.

Note: Hours worked and years of schooling data are for all employed persons aged 15+ unless otherwise noted. IPUMS is the International Public-Use Microdata Series; EPDC is the Education Policy and Data Center

¹Sample includes employed persons aged 10+.

²Sample includes employed persons aged 5+.

³Sample includes economically inactive persons.

⁴Computed from intervalled hours data.

⁵Sample consists of heads of households only.

I.C. Data Set

Table I.C below presents the data set used in the paper. The variables in the table are as follows; see the paper for the exact definitions of each variable.

gdppc - GDP per capita

emp_share_a - employment share in agriculture

va_share_a - value added share of agriculture

apg_raw - raw agricultural productivity gap

apg_adj - adjusted agricultural productivity gap

apg_adj_imp - adjusted agricultural productivity gap (imputed where missing data)

hrs_i - average hours worked

hrs_a - average hours worked, agriculture

hrs_n - average hours worked, non-agriculture

s_i - average years of schooling

s_a - average years of schooling, agriculture

s_n - average years of schooling, non-agriculture

h_i - human capital

h_a - human capital, agriculture

h_n - human capital, non-agriculture
